

Resolution

Image resolution is typically described in PPI, which refers to how many pixels are displayed per inch of an image.

Images with lower resolutions have fewer pixels.

Resolution of an image $W \times H$ means the total no. of horizontal pixel is W and H is the no. of vertical pixel.

Resolution

- ① Spatial resolution
- ② Intensity resolution

Spatial resolution is a measure of the smallest discernible detail in an image. Spatial resolution is important as it influence how sharply we see objects. It can be measured as dot (pixel) per unit distance, line pairs per unit distance.

Intensity resolution refers to the smallest discernible change in intensity level, which determines the clarity or sharpness of an image.
